Uutta tietoa tupsahti taas postilaatikkoon ja sain hetken aikaa nauttia vaihtoehtoisen faktan tuottamasta hyvästä olost.

Dear Friends,

Polar bears are going extinct due to global warming etc etc etc. etc. Right? I, but not the authors, which again warned about global warming, noticed that the first polar bear fossil 130-110 k old was discovered on Svaldbard during the Eemian inter-glacial, the warmest in 400,000 years.

So, polar bears are living in Svaldbard when Arctic temperatures were 8 ± 4 °C degrees higher than today, (9 °C in Siberia) when sea-levels were at least 5-9 meters higher than today, in an Arctic marine environment and feeding, like modern polar bears, on seals and small whales.

See Matt Kaplan. Ancient polar-bear fossil yields genome. Oldest mammalian DNA sequence reveals link to brown bears. 1 March 2010 | Nature | doi:10.1038/news.2010.99
